1. Project Overview

Social Cup is a coffee membership and discovery app for Dallas. Members pay a monthly subscription and receive a set number of drink credits. They spend those credits on real drinks at a curated network of partner cafes, by showing a code at the counter. Alongside the membership, the app helps people find cafes near them and rate the individual drinks they try, rather than the cafe as a whole.

Coffee lovers in Dallas discover new cafes through scattered reviews, paid advertising, and influencer posts, and none of that tells them whether a particular drink is worth ordering. Independent cafes have no simple way to attract repeat visitors without discounting through a large marketplace. Social Cup connects the two sides. Members get a predictable monthly benefit and a private record of everything they drink. Cafes get paying customers through the door, and a monthly statement showing exactly what was redeemed and what they are owed.

The product is delivered as a mobile app for iPhone and Android, a web admin panel for the Social Cup team, and a lightweight web page that baristas use to validate a member's code at the counter. Cafes need no app, no account, and no hardware beyond a phone or tablet they already own. The membership is bought inside the app through Stripe, using Apple Pay, Google Pay, or a card. Every redemption is validated by the server and recorded against that cafe's agreed rate, so what a cafe is owed is never in dispute.

This document defines the first release. It covers discovery, drink ratings, the paid membership, redemption at the counter, and the tools the Social Cup team needs to run the network day to day. Capabilities that only become useful once the member base and cafe network have grown are listed under Out of Scope and are planned for later releases.

2. Target Audience and Roles

Member (Paying Subscriber)

The paying user of the platform. Buys the membership, redeems credits at partner cafes, and keeps a personal record of the drinks they have tried.

- Subscribes for \$24.99 a month and receives 30 drink credits.
- Redeems a drink at any partner cafe using a code on their phone.
- Rates individual drinks and builds a personal drink diary.
- Browses, searches, and filters the full cafe network.

Visitor (Registered, Not Subscribed)

Someone who has created an account but has not subscribed. Explores the app freely but cannot redeem a drink.

- Browses, searches, and filters every partner cafe.
- Rates drinks and keeps a drink diary.
- Sees the membership screen when tapping Redeem.
- Becomes a Member at any time by subscribing.

Barista (Partner Cafe Staff)

Staff working the counter. Scans the member's code and reads a green or red result. Holds no account and installs no app.

- Opens a private scan page in the browser on the cafe's own phone or tablet.
- Enters the cafe PIN once per device, after which that device stays trusted.
- Scans the member's code, or types the six digit backup code.
- Sees a green screen when the code is valid, and a red screen with the reason when it is not.

Platform Administrator (Social Cup Team)

Runs the platform from a web panel. Owns the cafe network, the drink pricing, the curation, and the payments made to cafes.

- Adds partner cafes and sets each cafe's payout rate per credit.
- Prices every drink in credits and sees the resulting margin immediately.
- Chooses which cafes members see first using a featured flag.
- Reviews the redemption log, exports statements, and records payments to cafes.

3. Project Scope

In Scope (Phase 1)

Platform and Architecture

- React Native mobile app for iPhone and Android, from a single codebase.
- React web admin panel for the Social Cup team.
- Lightweight web scan page for baristas, with no app and no account.
- Node.js backend with a PostgreSQL database, hosted on AWS.

Onboarding and Authentication

- Sign up and log in with an email address, a Google account, or an Apple account.
- Profile setup capturing coffee preferences and a home neighbourhood.
- Free browsing and rating for registered users who have not yet subscribed.

Shop Discovery

- A searchable list of every partner cafe, ordered with the nearest first.
- Filtering by Dallas neighbourhood and searching by cafe name.
- Curated strips showing featured cafes and signature drinks.

Shop Detail Pages

- Photos, opening hours, address, and one tap directions for each cafe.
- The full drink menu, showing the credit price alongside the retail price.
- Star ratings on each drink, and a single button to redeem.

Drink Ratings and Drink Diary

- Star ratings and optional short notes on individual drinks.
- A personal drink diary on the member profile.
- A cafe score calculated from the ratings of the drinks it serves.

Curated Discovery

- An administrator flag that places chosen cafes at the top of the list.
- Signature drinks selected for each cafe and shown on the Discover screen.
- Preference matching and distance ordering beneath the curated picks.

Membership and Credits

- One paid plan at \$24.99 a month, including 30 drink credits.
- In app checkout through Stripe, offering Apple Pay, Google Pay, and card.
- A credit ledger that grants, deducts, and resets credits every month.
- A payout rate per cafe, stored on every redemption at the moment it happens.

Redemption and Barista Validation

- A single use code on the member's phone, valid for five minutes.
- A private scan page for each cafe, protected by a PIN.
- Server side validation returning a green or red result in about three seconds.
- A six digit backup code for when a camera cannot read the QR code.

Admin Panel

- Cafe onboarding, payout rates, and drink pricing with margin shown live.
- A full redemption log with filters, CSV export, and the ability to void an entry.
- A payout run that records what has been paid to each cafe and when.
- Member management, including account status and credits remaining.

Platform Setup and Deployment

- Development, staging, and production environments on AWS.
- Error monitoring, and scheduled jobs that reset member credits each cycle.
- Transactional email configured on the Social Cup domain.

Quality Assurance and Launch

- Concurrency and replay testing on the credit ledger.
- Full regression across iPhone, Android, and both web surfaces.
- App Store and Google Play submission, and production deployment.

Out of Scope (Phase 2)

- A self service portal where cafes manage their own menus and pricing.
- Automated bank payouts to cafes.
- Push notifications.
- Reporting and analytics beyond the CSV export.
- Ranking that responds automatically to community activity.
- Credit top up purchases within a billing month.
- Order ahead and collection.
- Subscription checkout inside the mobile app.
- Offline scanning when a cafe loses its internet connection.
- Connections between members and named groups.
- An activity feed showing what a member's connections are doing.
- Saving cafes, and seeing which connections have saved the same cafe.
- Meetup planning, midpoint suggestions, and check in.

4. Architecture Summary

Architecture Overview

Social Cup runs on one mobile app for members and two web surfaces: an admin panel for the Social Cup team, and a scan page for baristas. A single Node.js backend holds all the logic, including sign in, the credit ledger, and code validation. All records sit in a PostgreSQL database on AWS. Photos are stored in AWS S3 and delivered through CloudFront. Stripe handles the subscription, the payment sheet inside the app, and cancellations. Members pay inside the app rather than through Apple's in app purchase, because the credits buy physical drinks at physical cafes. The barista scan page is an ordinary web page, so a cafe needs nothing beyond a phone or tablet it already owns.

Architecture Components

Frontend

- Mobile app: React Native for iPhone and Android, one shared codebase.
- Admin panel: React web application, accessible from any browser.
- Barista scan page: lightweight mobile web page, no app and no account.
- Membership checkout: Stripe's native payment sheet, presented inside the mobile app.

Backend

- Node.js with Express: REST API, business logic, credit ledger, code validation, and Stripe webhooks.

Database and Storage

- PostgreSQL on AWS RDS for all records.
- AWS S3 with CloudFront for cafe and drink photos.

Authentication

- Email and password, using secure tokens that refresh in the background.
- Google Sign In, and Apple Sign In which Apple requires whenever Google is offered.

Communication and Notifications

- A transactional email service for account verification and password reset.
- Stripe sends receipts, renewal notices, and payment failure emails.
- Push notifications are not included in this release.

Payments

- Stripe subscriptions, sold through Stripe's payment sheet inside the mobile app.
- Apple Pay, Google Pay, and card presented in one native sheet.
- A Stripe hosted page, opened from the app, handles cancellation and card updates.

Supporting Services

- Google Places, used only to autofill a cafe address in the admin panel.
- Sentry, for error and crash monitoring across all surfaces.

A system architecture diagram will be attached.

5. Main Modules and Sub-Modules

Each module below is written so that a developer knows what to build, a designer knows what to design, and the client can decide what stays in this release.

Module 1: Platform Setup and Deployment

The foundation the product runs on. None of it is visible to a member, and all of it is what makes the platform safe to operate.

1.1 Environments and Infrastructure

- Separate AWS environments for development, staging, and production.
- A PostgreSQL database, S3 photo storage, and CloudFront delivery.
- A continuous integration and deployment pipeline.
- SSL certificates installed and HTTPS enforced across every surface.

1.2 Monitoring and Scheduled Jobs

- Error and crash monitoring on the app, the admin panel, and the scan page.
- A scheduled job resets every member's credit balance at the start of each billing cycle.
- A second scheduled job clears redemption codes that were generated but never scanned.

1.3 Email Delivery

- A transactional email service configured on the Social Cup domain.
- SPF and DKIM records set so verification and reset emails reach the inbox.

Module 2: Onboarding and Authentication

How a person creates an account, proves who they are, and tells the app what they like. The preferences captured here decide how cafes are ordered for them later.

2.1 Sign-up and Login

- Sign up and log in with an email address and a password.
- Continue with Google, creating an account in one tap.
- Continue with Apple on iPhone, which Apple requires whenever Google sign in is offered.
- Sessions use secure tokens that refresh in the background without asking the member to log in again.

2.2 Email Verification and Password Reset

- The system emails a verification link when someone signs up with an email address.
- Forgot password sends a reset link that expires after one hour.

2.3 Profile Setup

- Display name, captured during signup.
- Profile photo, optional and skippable.
- Coffee preferences, choosing any of matcha, espresso, cold brew, and latte.
- Home neighbourhood, chosen from a set list of Dallas areas.

2.4 Location Permission

- The app asks for location once, and explains that it is used to sort cafes by distance.

- If the person declines, distance sorting turns off and the neighbourhood preference orders the list.

2.5 Account States

- Visitor: registered but not subscribed, with full access to browse, search, and rate.
- Member: subscribed, with everything a Visitor can do plus credits and redemption.
- Payment gates the Redeem button, and nothing else in the app.

2.6 Account Deletion

- A member can delete their account from inside the app, which Apple requires.
- Deleting an account cancels any active subscription.

⚠ Need Confirmation: This document assumes that registered users can browse, search, and rate without subscribing, and that payment is required only in order to redeem a drink. Please confirm before Module 7 is built.

Module 3: Shop Discovery

The first screen a member sees. A sorted, searchable list of every partner cafe. The app reads location in the background to order by distance. There is no map in this release.

3.1 Discover Screen

- A curated strip at the top showing the cafes the administrator has featured.
- A signature drinks strip below it, each drink linking to its cafe.
- The full cafe list underneath, ordered with the nearest first.
- A toggle that turns distance sorting off.

3.2 Cafe Card

- Cover photo, cafe name, neighbourhood, and distance.
- Vibe tags, for example good for remote work.
- The lowest credit price on the menu, shown as drinks from 4 credits.
- Average star rating, or a New badge when no drink has been rated yet.

3.3 Filter and Search

- A neighbourhood filter, which defaults to the member's saved neighbourhood.
- Search by cafe name, with the list filtering as the person types.

3.4 Screen States

- Loading, shown as a skeleton list rather than a spinner.
- Empty search result, with a prompt to clear the search.
- Location denied, which hides distance and orders by neighbourhood instead.
- Offline, with a retry button.

Module 4: Shop Detail Pages

The full page for a single cafe. Everything a person needs in order to decide to visit, rate a drink, or redeem right now.

4.1 Cafe Information

- A photo gallery of up to five images.
- Cafe name, neighbourhood, and full address.

- Opening hours for each day, with an open noThe member subscribes directly within the mobile app using Stripe's native payment sheet.
- The payment sheet presents the available payment methods on the device, including Apple Pay (iOS), Google Pay (Android), and supported credit or debit cards, without redirecting the user to a web browser.
- Once Stripe successfully confirms the payment, the backend activates the membership, grants the member **30 drink credits**, and updates the account status to **Member** immediately.
- A signature badge on the drinks the administrator has flagged.

4.3 Actions

- Get Directions opens Apple Maps on iPhone and Google Maps on Android.
- Rate a drink opens the drink picker and then the rating sheet.
- Redeem here is the primary button, and what it does depends on the account state.

4.4 Redeem Button Behaviour

- A Visitor is shown the membership screen.
- A Member with credits opens the drink picker.
- A Member with no credits sees a disabled button and their renewal date.
- A Member whose payment has failed sees a disabled button and a prompt to update their card.

Module 5: Drink Ratings and Drink Diary

Members rate the individual drinks they order rather than the cafe as a whole. A cafe's score is built from the drinks people actually buy there.

5.1 Rating a Drink

- A member gives a drink a rating from one to five stars.
- They may add an optional note of up to 140 characters, or skip it entirely.
- One rating per member per drink, which they can edit at any time.

5.2 Where a Rating Happens

- The app prompts for a rating immediately after a successful redemption, since it already knows the cafe and the drink.
- A member can also rate any drink from the cafe page without redeeming it.
- Visitors can rate drinks, so the app has real content from the first week.

5.3 Drink Diary

- A screen on the member profile listing every drink they have rated, highest rated first.
- Each entry shows the drink, the cafe, the stars, the note, and the date.

5.4 How Ratings Appear

- Each drink shows its own average and rating count on the cafe page.
- A cafe's star rating is the average of its drinks' ratings, so there is no separate cafe review.
- A cafe with no rated drinks shows a New badge in place of a rating.

Module 6: Curated Discovery

A new network has no ratings and no activity to rank, so the administrator decides what members see first. Ranking that responds to community activity is planned for a later release.

6.1 Ranking Order

- Featured cafes appear first, set by a flag in the admin panel.
- Then cafes whose coffee type matches the member's stated preference.
- Then the nearest cafes.
- The section is labelled New on Social Cup.

6.2 Signature Drinks

- The administrator flags one or more signature drinks for each cafe.
- These appear as a curated strip on the Discover screen.

6.3 Rules

- The featured flag is switched on and off by hand and does not expire on its own.
- There is no scoring, no weighting, and no background ranking job in this release.

Module 7: Membership and Credits

The paid plan and the credit system that sits behind every drink. This module holds the money, so its rules are stated exactly.

7.1 The Plan

- One paid plan at \$24.99 a month.
- The plan includes 30 drink credits each month.
- One credit is worth one dollar at any partner cafe.
- Credits reset every month and do not roll over.

7.2 Subscribing

- The member subscribes inside the app, using the payment sheet provided by Stripe.
- Apple Pay, Google Pay, and card are offered in one native sheet, with no redirect to a browser.
- When Stripe confirms the payment, the backend grants 30 credits and marks the account as a Member.
- The member can redeem a drink straight away.

7.3 Credit Ledger

- Credits are granted only when Stripe confirms a payment.
- Credits are deducted only when a barista scans a code, never when a code is shown.
- A scheduled job resets the balance to 30 on each successful renewal.
- There are no rollovers and no credit top up purchases in this release.

7.4 Membership Lifecycle

- Stripe sends the receipt, the renewal notice, and any payment failure email.
- The member cancels or updates their card from inside the app, which opens a secure page hosted by Stripe.
- After cancelling, access and credits continue to the end of the paid period, then the account returns to Visitor.
- If a renewal payment fails, Stripe retries, the account shows as inactive, and redeeming is disabled.

7.5 Cafe Payout Rate

- Each cafe has its own payout rate, in dollars per credit, set by the administrator.
- The rate is copied onto every redemption record at the moment it happens.
- Renegotiating a rate later therefore never changes a past month's statement.

7.6 App Store Compliance

- Credits are redeemed for physical drinks at physical partner cafes, and never for anything digital.
- Apple guideline 3.1.5(a) requires goods and services consumed outside the app to use a payment method other than in app purchase.
- Softaims submits review notes citing that guideline, together with comparable apps, alongside the first build.
- The product sells a membership that includes 30 drink credits. It never describes credits as coins, tokens, or a wallet balance.
- Credit top up purchases are not offered in the app, because they would present credits as a digital currency.

Note: If Apple's review team rejects in app checkout despite the above, the alternative is to sell the membership through a Stripe checkout page on the Social Cup website. That alternative is not included in this proposal. It will be scoped, estimated, and quoted separately as a change request, and is expected to require roughly 10 to 12 hours.

Module 8: Redemption and Barista Validation

Where the membership meets the counter. The barista makes no decisions and performs no calculations. They point a camera and read a green or red screen. The server checks every rule and deducts the credit.

8.1 Member Side

- The member opens the cafe page at the counter and taps Redeem here.
- They pick a drink, and see its credit cost and the balance they will be left with.
- On confirming, a code fills the screen with a five minute countdown.
- The countdown starts when the member confirms at the counter, not while they are queuing.
- A six digit backup code is available if a camera cannot read the code.
- The screen changes to Redeemed within about two seconds of a successful scan.
- The app then prompts the member to rate the drink they have just bought.

8.2 Barista Side

- The cafe opens a private scan link in the browser on its own phone or tablet.
- They enter the cafe PIN once, and that device stays trusted from then on.
- The camera opens as soon as the page loads. There is no app and no account.
- A green screen shows the member's first name and photo, the drink, and the credits deducted.
- A red screen shows a single reason: expired, already used, membership inactive, not enough credits, wrong cafe, or no connection.
- A Today tab lists that cafe's redemptions for the current day.

8.3 Validation Rules

- Credits are deducted only on a successful scan, so a member who walks away loses nothing.

- Every code is single use, valid for five minutes, and tied to one cafe and one drink.
- A member may hold only one live code at a time, and generating a new one cancels the old one.
- The deduction runs inside one locked database transaction, so a code can never be used twice.
- The cafe's payout rate is written onto the redemption record at that moment.
- If the connection drops, the scan fails safely and no credits are deducted.

8.4 Scanner Access and Security

- Each cafe has its own scan link and its own PIN.
- The link is not a secret. The PIN is the credential, and PIN attempts are rate limited.
- The administrator resets a PIN to sign out every trusted device for that cafe at once.
- Staff must never accept the member's own screen as proof. If the cafe screen is not green, the redemption did not happen.

Module 9: Admin Panel

The web control room for the Social Cup team. Every cafe, every drink price, every redemption, and every payment made to a cafe is managed from here.

9.1 Dashboard

- Total members, active cafes, redemptions this month, and credits redeemed.
- Total owed to cafes, and total margin for the period.

9.2 Settings

- The credit value in dollars, currently one credit equals one dollar.
- Plan price and credit allowance, shown read only because they are held in Stripe.

9.3 Cafe Management

- Add a cafe with name, address, opening hours, coordinates, photos, vibe tags, and perk line.
- Set that cafe's payout rate in dollars per credit.
- Turn the featured flag on or off to control what new members see first.
- Edit or remove a cafe at any time.
- Generate the cafe's scan link, and set or reset its PIN.

9.4 Menu and Pricing

- Add and edit drinks for each cafe, with name, type, description, photo, and signature flag.
- Enter the retail price and the credit price for each drink.
- Turn any drink on or off without deleting it.

9.5 Live Pricing Calculator

- What the member pays in credits, and what that is worth in dollars.
- How much the member saves against the retail price.
- How much Social Cup pays the cafe for that drink.
- The margin Social Cup keeps, updated as the prices are typed.

9.6 Members

- List every member with their plan, status, join date, and credits remaining.

- Deactivate an account when needed.

9.7 Redemption Log

- Every redemption across every cafe, filtered by date range and by cafe.
- Columns for member, cafe, drink, credits, member value, cafe payout, margin, and time.
- Void a redemption, which restores the member's credits and removes it from the cafe's payout.
- Every void is recorded with who performed it and the reason given.

9.8 Payouts

- Choose a period, then see each cafe's redemptions, credits, and the amount owed.
- Export one cafe's redemptions to CSV, to send as their monthly statement.
- Record a payment with its amount, date, and reference once the bank transfer is made.
- The amount owed resets for the next period, and full payout history is retained.

Module 10: Quality Assurance, UAT and Launch

Testing weighted towards the parts of the product that move money. The credit ledger receives more attention than any screen.

10.1 Test Coverage

- A test plan covering the mobile app, the admin panel, and the barista scan page.
- Concurrency testing on the credit ledger, including two devices scanning one code at the same moment.
- Expiry, replay, and retry testing across the full redemption flow.
- Full regression on both iPhone and Android.
- Cross browser testing on the admin panel and the scan page.

10.2 Acceptance and Launch

- Client user acceptance testing on real devices, at a real cafe counter.
- App Store and Google Play submission, with review notes prepared in advance.
- Production deployment with monitoring active.
- Softaims fixes any bug found within two weeks of production deployment at no charge.

6. Engagement Options

Phase 1 is offered two ways, depending on who produces the design.

Option A: Design Sprint Included

- Softaims designs every mobile app screen and the barista scan page.
- Two rounds of client review are included before development begins.
- The admin panel is built to the interactive prototype supplied with this document.
- Design effort adds 40 to 44 hours to the schedule.

Option B: Build Only, Against Client Supplied Designs

- The client's designer delivers the mobile app screens in Figma.

- Softaims builds directly against those designs, with no design sprint.
- The admin panel and barista scan page are built to the interactive prototype.
- This option places the look and feel with the designer who already knows the brand.

What Dev Ready Figma Means

If Option B is selected, the designs must include all of the following. Anything short of this is treated as a change request.

- Every screen in this document, with nothing left to interpretation.
- Every state for each screen, including empty, loading, error, and success.
- A component library, so that buttons and cards are reusable.
- Spacing, type, and colour tokens.
- All assets exported at 1x, 2x, and 3x.
- One handover walkthrough with the engineering team.

If the designs arrive after the start of week 2, the delivery timeline moves day for day.

Exact list of items will be shared if the client chooses to go with this option.

7. Project Timeline

Ref	Description	Effort (hrs)	Duration	Timeline
Module 0	UI/UX Design Sprint (Option A only)	40 - 44	1 week	Week 1
Module 1	Onboarding and Authentication	18- 20	0.5 week	Weeks 1-2
Module 2	Shop Discovery	19 - 20	0.5 week	Week 2 -3
Module 3	Shop Detail Pages	19 - 20	0.5 week	Week 3
Module 4	Drink Ratings and Drink Diary	23 - 24	0.5 week	Weeks 3
Module 5	Curated Discovery	16- 18	0.5 week	Week 3-4
Module 6	Membership and Credits	44- 47	1.5 weeks	Weeks 4-5
Module 7	Redemption and Barista Validation	43- 45	1.5 weeks	Weeks 5-6
Module 8	Admin Panel	47 - 49	1.5 weeks	Weeks 6-7
Module 9	Quality Assurance, UAT and Launch	36 - 39	1 week	Weeks 8

Ref	Description	Effort (hrs)	Duration	Timeline
Total	Phase 1, excluding the design sprint	265 - 282 hrs		~7 weeks (No design)

- **Note:** The timeline is an estimate. A 15 to 20 percent buffer is included for third party delays, client feedback cycles, and agreed scope changes.
- **Deployment and Maintenance:** The hours above cover feature development and QA only. Post launch maintenance is quoted separately. Softaims fixes any bug found within 2 weeks of production deployment at no charge.

8. Key Delivery Milestones (Phase 1)

M#	Milestone	Weeks	Description / Deliverables	Acceptance Criteria (UAT)	Team	Est. Hours
M0	UI/UX Design Sprint (Option A only)	Wk 1	Full design of every mobile app screen and the barista scan page. Two rounds of client review. Component library, design tokens, and asset export.	• All Phase 1 screens designed and approved in writing • Every screen includes empty, loading, error, and success states • Component library and design tokens delivered • Assets exported at 1x, 2x, and 3x	UI/UX Designer, PM/TL	40–44 hrs
M1	Account Access and Cafe Discovery	Wk 1–2	Modules 1–4. AWS environments, database, pipeline, and monitoring. Sign in with email, Google, and Apple. Profile and preferences. Cafe list with sorting, filtering, and search. Full cafe detail pages.	• Demo: user signs up, sets preferences, browses cafes, and opens a cafe page • Sign in works using all three methods on both platforms • Verification and password reset emails work reliably • Cafe list sorts by distance, filters by neighbourhood, and searches by name • Zero critical bugs	PM/TL, Backend, Mobile, QA	56–60 hrs
M2	Administrator Panel	Wk 2–3	Module 9. Cafe onboarding, payout rates, drink pricing with live margin calculator, member list, redemption log with filters and void, CSV export, and payout recording.	• Demo: administrator adds a cafe, prices its menu, and completes a payout run • Amount owed per cafe is calculated correctly • Voiding restores credits and adjusts payouts • CSV exports open correctly in Excel • Zero critical bugs	Frontend, Backend, QA	47–49 hrs
M3	Drink Ratings and Curation	Wk 3–4	Modules 5–6. Drink rating flow, optional notes, drink diary, rating averages, featured cafes, signature	• Demo: member rates a drink, sees it in the diary, and cafe rating updates • Cafe rating equals the average of its drink	Mobile, Backend, QA	39–42 hrs

			drinks, and curated discovery ordering.	ratings• Featured cafes and signature drinks appear first• Zero critical bugs		
M4	Membership, Payments and Redemption	Wk 4–6	Modules 7–8. Stripe subscriptions and payment sheet, webhooks, credit ledger, monthly resets, cancellation, payment failure handling, member redemption codes, barista scan page, PIN/device trust, locked credit deduction, and Today tab.	• Demo: member subscribes, receives 30 credits, generates a code, and redeems successfully• Credits deduct only after a successful scan• Codes cannot be reused, including concurrent tests• Expired and incorrect cafe codes are rejected• Payout rate stored on every redemption• Failed renewals disable redemption• Zero critical bugs	Backend, Mobile, Frontend, QA	87–92 hrs
M5	Platform-Wide UAT, Client Sign-Off and Production Launch	Wk 6–7	Module 10. Full regression across mobile and web, concurrency and replay testing, client UAT, App Store and Google Play submission, and production deployment.	• All member, barista, and administrator journeys tested• All P1 and P2 issues resolved• Credit ledger concurrency and replay tests pass• Client UAT approved in writing• Platform live with HTTPS, monitoring enabled, and apps submitted	QA, All Engineers, PM/TL	36–39 hrs
	Phase 1 Total (Option B - Excluding Design)	7 Weeks			265–282 hrs	
	Phase 1 Total (Option A - Including Design)	8 Weeks			305–326 hrs	

8. Team Composition

Role	Capacity	Primary Responsibilities
Project Manager / Tech Lead	1 FTE	Delivery oversight, architecture decisions, client communication, and sprint planning.
Mobile Engineer (React Native)	1 FTE	All member screens, navigation, API integration, code generation, and store builds.
Backend Engineer (Node.js)	1 FTE	REST API, sign in, credit ledger, code validation, Stripe webhooks, and deployment.
Frontend Engineer (React)	0.5 FTE	The admin panel and the barista scan page.
QA Engineer	0.5 FTE	Test planning, concurrency testing on the ledger, regression, and UAT support.
UI/UX Designer	0.5 FTE	Design system and all screens. Required for Option A only.

Total resource count: approximately 4 FTE under Option B, and approximately 4.5 FTE under Option A.
